90-Day Growth Funnel

Investment Scorecard

Competitor Price Comparison

Pricing Ladder

Tier	Price	Included
Free	₹0	5 doubt-solves/day, generic answers
Plus (Monthly)	₹99/mo	Unlimited doubts, Hinglish explanations, basic prediction
Pro (Annual)	₹799/yr	Everything in Plus + university-specific prediction, priority response
Exam Sprint Pack	₹49 / 3 days	Unlimited access during exam week (panic-buy moment)

1. Business Reality Check

Reality Factor	Assessment
Market Size	Large — 40M+ college students in India, majority in tier 2/3 cities and private universities
Willingness to Pay	Low-to-moderate. ₹0–500/month budget confirmed from ICP. Panic-buying behavior near exams, not steady spend
Competitive Intensity	High — free alternatives (YouTube, ChatGPT free, Brainly, Quora) already meet 70% of the need
Timing	Good — AI tools are newly trusted by this segment, reducing "is AI legit" objection
Founder Advantage Needed	Must win via language (Hinglish), trust (peer-verified), and hyperlocal exam-pattern alignment — not raw AI capability
Hard Truth	The product does not compete on "having AI." It competes on being useful minutes before a paper, in a way generic AI chat tools don't out of the box

Reality Check Verdict: Viable, but only if the MVP is scoped around a narrow, painfully specific job — not a general "AI tutor."

2. Business Model Canvas

Block	Details
Customer Segments	Tier 2/3 college students (19–23), semester 2–8, state/private universities, ₹0–500/month tool budget
Value Proposition	"Solve my doubt and predict my exam questions in Hinglish, in minutes, on my phone, before I panic"
Channels	WhatsApp groups, Instagram Reels, YouTube Shorts, peer referral, college communities
Customer Relationships	Community-led (WhatsApp groups), self-serve app, peer trust
Revenue Streams	Freemium subscription (₹99–199/mo), annual plan (₹799), exam-season packs (₹49/3 days)
Key Resources	LLM API access, curated syllabus/question-bank data, Hinglish tuning, WhatsApp distribution network
Key Activities	Doubt-solving engine, exam-pattern prediction, syllabus curation, community management
Key Partnerships	College toppers/seniors, local coaching centers, campus ambassadors, group admins
Cost Structure	LLM inference costs, content curation, referral-driven CAC, support/community ops

3. Revenue & Pricing Strategy

Model: Freemium + panic-season packs. **Rationale:** ICP shows panic buying near exams and churn right after, so a short-duration pack captures revenue at the exact decision-trigger moment instead of forcing a 12-month commitment upfront.

Price Sensitivity

Near-zero tolerance for subscriptions with unclear ROI; highly anchored to "less than one food delivery order" (~₹100–150); annual plans need 60%+ discount vs monthly rate to justify upfront payment.

Competitor Price Comparison

Competitor	Price	Gap We Exploit
ChatGPT Plus	₹1,700+/mo	Too expensive, not India-exam-tuned
Brainly	Free / ~₹300/mo	English-first, generic, not syllabus-specific
Physics Wallah / Unacademy add-ons	₹500–3000+	Built for full coaching, not quick doubt-solving
Our App	₹49–99	Cheapest AI-specific, Hinglish-native, exam-week optimized

4. Go-To-Market Strategy

- Phase 1 — Seed (Wk 1–4):** Land in 3–5 WhatsApp study groups per target college via campus ambassadors; free unlimited access for first 100 users in exchange for feedback + referrals.
- Phase 2 — Local Proof (Wk 5–10):** Convert seed users into case studies; push short-form video featuring real student results in Hinglish.
- Phase 3 — Exam-Season Spike:** Launch Exam Sprint Pack push 10 days before major university exam windows — the highest-intent moment per ICP spending behavior.
- Phase 4 — Expand:** Move from 3–5 anchor colleges to a city cluster, replicate the ambassador model.

5. Customer Acquisition Strategy

Channel	Tactic	Cost Level
WhatsApp Groups	Ambassador seeding + "share to unlock" free credits	Low
Instagram/YouTube Shorts	Real-student-result clips, exam-prediction reveals	Low–Medium
Referral Loop	"Invite 3 friends, get 7 days Pro free"	Low
Campus Ambassadors	Local toppers/seniors paid per signup + rev-share	Medium
College Group Admins	Partner for pinned-message access to whole batch	Low

CAC Discipline: Given the ₹0–500 monthly budget and price-sensitive buyer, CAC must stay under ~₹30–40/user. Paid ads are not recommended at MVP stage — organic/referral/community channels only.

6. First 100 Users Plan

1. Identify 3 anchor colleges from the ICP location list (Lucknow, Kanpur, Gorakhpur, Indore, Nagpur).
2. Recruit 5 student ambassadors, one per WhatsApp group of 50–100 members.
3. Offer full free access for 30 days to the first 100 sign-ups in exchange for structured feedback.
4. Run a "predict my exam question" contest the week before finals to drive urgency.
5. Collect testimonials/screenshots right after results are declared — these become GTM content assets.
6. Track activation and Day-7 retention as core success signals, not just raw signups.

7. Competitive Position & Moat

Position: The AI study buddy that actually speaks your language and knows your syllabus — a hyper-local exam companion, not a general AI tutor.

Moat Sources (ranked by durability)

1. University-specific question-bank/data accumulated over time (hardest to replicate)
2. Community trust network via WhatsApp/campus ambassadors (slow to build, slow to copy)
3. Hinglish tuning of AI responses (moderate — copyable but takes real effort)
4. Price point (weak moat — easily undercut)

Risk: Raw LLM capability is not a moat; large players could add India-specific features. The moat must be built on data + community + local trust, not model quality.

8. Reverse SWOT Analysis

Normally...	Reframed as risk/opportunity
Strength → Hidden Weakness: Low price point	Attracts price-sensitive, high-churn users; may struggle to reach sustainable unit economics
Weakness → Hidden Strength: No brand recognition yet	Allows flexible positioning; can pivot messaging fast based on real feedback, unlike incumbents
Opportunity → Hidden Threat: AI trust is rising fast	Rising trust also lowers switching cost — users can as easily trust a competitor's AI tomorrow
Threat → Hidden Opportunity: ChatGPT already used daily by segment	Signals proven AI adoption behavior; validates the interaction model, reduces need to "teach" AI usage

9. Investor One-Liner and Founder Pitch

One-Liner: An AI doubt-solving and exam-prediction app built in Hinglish for India's 40M+ tier 2/3 college students — priced for panic-buy moments, not monthly budgets.

Founder Pitch: Tier 2/3 college students are drowning in exam anxiety, backlog fear, and English-only study tools that don't match how they actually think or talk. They already trust AI — they use ChatGPT daily — but existing tools are too expensive, too generic, and too English-first. We built a Hinglish-native AI exam companion that solves doubts instantly and predicts likely exam questions by syllabus, priced at less than one food delivery order, timed to the exact moment students are desperate enough to pay: exam week.

10. Final Verdict

Go — with a narrow MVP scope

This is a fundable, buildable idea only if the MVP resists the temptation to be a general AI tutor. The winning wedge is: Hinglish doubt-solving + syllabus-specific exam prediction, distributed through WhatsApp/campus networks, monetized around exam-week urgency.

Biggest risk is not building the AI — it's acquisition and retention discipline in a segment that churns hard after exams. Success depends on treating community trust and university-specific data as the real product, with AI as the delivery mechanism, not the pitch.
